

STERAS M1–M5 End-to-End Verification

Firebase project linkos-496505 · Application iTpN6WjUEKtgQFWElIE1 · Version v1

Module	Checkpoint	Production result
M1	Combined application extraction	PASS · 12 fields · 100%
M1	Evidence and canonical venue	PASS · 18/18 · KLCC active
M2	OpenWeather context	PASS · available · fresh
M2	MiniMax proposal	PASS · 8 unique categories
M2	Official assessment/resource	PASS · 28 Medium · 7 resources
M3	Authority score review	PASS · 4 active review heads
M3	Application decision	PASS · 4 officer approvals · Admin Approved
M3	Controls and evidence	PASS · 4 controls · 13/13 Stage 1 · 4 Stage 2
M4	Incident assessment and resolution	PASS · MiniMax · resolved
M5	Analytics	PASS · 1 verified High incident · complete coverage

Issue found and corrected

A new Draft's Firestore document ID was not persisted as **EventRecord.eventId**. Provisional processing used the trigger parameter and succeeded, while official resource finalisation correctly rejected the missing source identity as **missing_input**. No partial official output was published.

- The client now generates the document reference first and persists its exact ID.
- Firestore rules require eventId to equal the document path and reject missing or spoofed IDs.
- The submit boundary self-heals older Draft records.
- The same append-only review state was retried idempotently and finalized successfully.

A second adversarial check found that M3 could previously create a public discrepancy ticket before the M4 event window opened. M3 and M4 now share one reportable-event guard, preventing orphaned report locks.

- A production pre-event request was rejected and created no report ticket.
- The successful M4 evidence below was created only after the event began.

Data hygiene and recovery

- Managed Firestore recovery export completed before destructive cleanup.
- Obsolete fixture events, legacy incidents, test accounts and orphaned Storage objects were removed.
- Deleted Storage objects were copied to a restricted backup prefix and verified before removal.
- The final analytics portfolio contains one current non-synthetic demonstration application.

External services exercised

Service	Observed production result
MiniMax M2	MiniMax-M3 · v5.0.0-prd-numeric-proposal · success
MiniMax M3	MiniMax-M3 · v1.0.0-m3-control-list · success
MiniMax M4	Incident assessment success with validated severity output
OpenWeather	Available/fresh numeric measurement snapshot

Repository gate

Typecheck, lint, frontend unit tests, Functions unit tests, Firestore/Storage rule tests and production build all passed. Exact counts are retained in the accompanying Markdown report.

Scope note

All scenario names and supporting documents are realistic fictitious demonstration records. Resource ratios remain explicitly labelled internal prototype/unverified; this report is not evidence of a government permit or statutory recommendation.
